Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

New isolated human Ras-like protein polypeptide, useful for diagnosing, treating or preventing inflammation and disorders associated with cell proliferation and apoptosis, e.g. AIDS, cancer, allergies, anemia, asthma or stroke.

Claim 4; Page 73-74; 82pp; English

nucleic acid. The Ras-like protein and DNA is useful in the development of human therapeutics and diagnostic compositions. They are useful in the diagnosis, protein and respectable.

In the diagnosis prevention and treatment of inflammation and disorders associated with cell proliferation and apoptosis, e.g. AIDS and other infectious or genetic immunodeficiencies, neurodegenerative disease e.g. Alzheimer's disease, Parkinson's disease, wasting diseases e.g. cachexia, ischaemic injuries e.g. myocardial infarction, stroke or reperfusion injury, toxin-induced diseases such as alcohol-induced liver damage or injury, toxin-induced diseases such as alcohol-induced liver damage or injury, toxin-induced diseases such as alcohol-induced liver damage or injury, toxin-induced diseases such as alcohol-induced liver damage or injury, toxin-induced diseases such as alcohol-induced liver damage or careforming as disease, disease, glomerily allergies, atcopic dermatitis, atherosclerosis asterma, anaemia, crohn's disease, disease, glomerily adjaced such artitable bowel syndrome, lupus erythematosus, multiple sclerosis, osteoarthritis, pancreatitis, aucoimmune thyroiditis, rheumatoid arthritis, Sjogren's syndrome, cueitis, trauma, or viral, bacterial, fungal, parasitic, protozal or helminthic infections. The antibodies of the invention are useful in pharmacogenomic analysis or for tissue typing. The transgenic animals are and evaluating modulators of its activity. Ras like protein, and identifying and evaluating assays and its bNA is used in gene therapy. The present sequence is human Ras-like protein ecoding cDNA corresponding relates to human Ras-like protein and its invention

(HUMA-) HUMAN GENOME

Ruben SM Barash SC, Rosen CA,

NPI; 2001-483426/52

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure; SEQ ID NO 37097; 3071pp + Sequence Listing; English

AMXS4951 to AAX64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polymucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the

helminthic infections. The antibodies of the invention are useful in pharmacogenomic analysis or for tissue typing. The transgenic animals are useful for studying the function of a Ras-like protein, and identifying and evaluating modulators of its activity, Ras-like protein is used in drug screening assays and its DNA is used in gene therapy. The present sequence is human Ras-like protein encoding gene. This gene is located at

which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
antipsoriatic; antiparkinsonian; noctropic; neuroprotective; osteopathic;
anticonvulsant; antiarthritic; immunosuppressant; immunostimulant;
cardiant; thrombolytic; cagulant; vasotropic; antidabetic; hypotensive;
dermatological; immunosuppressive; antithyroid; and antianaemic. The
antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The
sequences can be used for determining the presence of or predisposition
to, or preventing or treating pathological conditions associated with an
CORFX-associated disorder. The nucleic acids can be used to express ORFX
proteins in gene therapy vectors. The proteins and nucleic acids may be
used to treat cancers, proliferative disorders, neurodegenerative
disorders, osteoarthritis, graft va host disease, cardiovascular disease,
diabetes mellitus, hypertension, hypothyroidism, cholesterol ester
continued setring of the proteins and immunodeficiency
(SCID), AIDS, viral, bacterial por fungal infection, malaria, autoimmune
contents asthma, allergies, aplastic anaemia, burns, wounds, bone and
cartilage damage, nocturnal haemoglobinuria, antinifiammatory disease; to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 enhance coagulation; to inhibit thrombosis; and as a contraceptive
                                                                                                                                                              Novel nucleic acids and peptides derived from open reading useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma an macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1696 GAGCATTTGGAAATGAAGGACTAGCTCCTATGTATCAGGTTAAGAGCAAGGGAGAGCTGG 1755

CC (NM 002538), TXNRD1 (NM 003330), UGT8 (NM 003360), MRP (NM 004956, NM 019900, NM_019901, NM_019902, NM_019862, NM 019898, NM 019899) and their complementary sequences, or a sequence (S1) chosen From 87 sequences and their complements. The chemical pretreatment is bisulphite treatment to convert cytosines (but not methyl-cytosines) into uracils. The office of treatment to convert cytosines (but not methyl-cytosines) into uracils. The office of treatment to convert cytosines (but not methyl-cytosines) into uracils. The office of treatment to convert cytosines (II) in particular an oligoment or a chemically pretreated by particular an oligoment or a chemically pretreated DNA of genes associated with characogenomics and their complements, arranged in an array for analysing diseases associated with the methylation state (CpG) and/or detecting SNPs (single nucleotide polymorphisms) of the 87 sequences. The oligomers may also be used as PCR primers. The set of 87 nucleic acids and their complements is useful for diagnosis and therapy of solid tumours and cancer. The present sequence represents one the 87 DNA continuous and cancer. The present sequence represents one the 87 DNA continuous problements in useful for diagnosis and therapy of solid continuous problement directly from WIPO at a continuous continuous directly from WIPO at continuous continuous directly from WIPO at continuous con

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, nevosacular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or amount of expression of the condition based on the presence or amount of expression of the condition based on the presence or amount of expression of the condition based on the presence or amount of expression of the condition based on the presence or absolute the binding partner to binding partner and determining whether the binding partner ceffects an activity of the polypeptide. The polypeptide or the nucleic acid encoding the polypeptide is useful for preventing, treating, or acid encoding the pulpeptide is useful for preventing, treating the condition or the nucleic acid to a mammalian subject. The nucleic acid is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject, which involves determining the presence or absence of a mutation in The nucleic acid, and diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility or autoimmune disease, Parkinson's disease, altherosclerosis, haemophilia, thrombocytopenia. The polypeptide, the nucleic acid and the antibody are useful as immunosuppressive agents, as adjuvants to enhance immune responses, and as agents to induce higher affinity antibodies and increase serum immunosuppressive agents. The present sequence represents colly encoding a novel human protein. Note:

The sequence data for this patent did not form part of the printed sequence higher and the sequence high and the angle of this patent did not form at the patent did not form the patent direct from U

                                                                                                                                                                                                  रुं है दे
                                                                                                                                                                                                                                                                      g
                                                                                                   The invention relates to an isolated polynuclectide (I) comprising one of 245 sequences (ABQ93288-ABQ93532). Treating a condition comprising administering to a mammalian subject a composition comprising the protein (II) encoded by (I) (ABP62809-ABP63053) or an antibody (III) to (II).

(I) is useful for gene therapy of diseases and (II) can be used for therapeutic treatment. Diseases that may be treated include wound healing and tissue repair, burns, central nervous system disorders (e.g. Alzheimer's, Parkinson's, Huntington's and amylotrophic lateral calerosis, diabetes and allergies. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences

This invention describes novel polypeptide fragments (I) and the polynucleotides (II) that encode them that are highly expressed in a human bladder tumour and which have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for treatment of bladder cancer, to directly treat this form of cancer (including expression from gene therapy vectors) or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling BSTs (expressed sequence tags) from a particular issue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures associated with the fact that ESTs from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 937

The invention relates to an isolated polypeptide. The polypeptide is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject, by determining the presence or amount of expression of the polypeptide in a biological sample and diagnosing a pathological condition or a susceptibility to a pathological condition based on the presence or amount of expression of the condition based on the presence or amount of expression of the polypeptide is also useful for identifying a binding partner to the polypeptide which involves contacting the polypeptide of the polypeptide. The polypeptide or the nucleic acid encoding the polypeptide is useful for preventing, treating, or ameliorating a medical condition, which involves administering the polypeptide or the nucleic acid to a mammalian subject. The nucleic acid a pathological condition or a susceptibility to a pathological condition in a subject, which involves determining the pathological condition or a susceptibility to a pathological condition or disease, atherosclerosis, haemophila, thrombocytopenia. The polypeptide, the nucleic acid and an antibody to the polypeptide are useful for treating autoimmune disease, Parkinson's disease, silicosis, gastrointestinal cathand and an antibody are useful as immunosuppressive agents, as adjuvants to enhance immune responses, and as agents to induce higher as adjuvants to enhance immune responses, and as agents to induce higher as present sequence data for this patent did not form part of the printed specification but was obtained in electronic format direct from USPTO at sequence that for this patent did not form part of the printed specification but was obtained in electronic format direct from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polypeptide useful for diagnosing and treating immunosuppressive conditions such as autoimmune disease and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 566 BP; 140 A; 145 C; 172 G; 103 T; 0 U; 6 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 3; SEQ ID NO 507; 345pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2941
                                                                                                       The invention relates to polynuclectides encoding colon tumour proteins. The polynuclectides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of Colon cancer. Polynuclectide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer. ABK44450-ABK46237 represent. Coding sequences of human colon tumour proteins of the invention. Note: With the exception of SEQ ID No 1 and 2, the sequence data for this patent did not form part of the printed specification but was supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CTAGGGAAGTAGGTGATGCCAGCCCTCAAGTCTGTCTTCAGCCAGGGACTTGAGAAGTTA 2701

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 16,
